

PRODUCT BENEFITS

Scanfoil is a mono-material with the possibility to add various options, such as; easy seal, ESD, anti-fog and a barrier.

The environmental impact of polyolefins is low and they are also requested in many industries that use recycled material. The polymer can be made from renewable resources, Scanfoil Bio, and has an even lower environmental impact.

Scanfoil is transparent with the choice of regular clarity or HiClear and is also available in various colors. The HiClear transparency is comparable with APET. Scanfoil can be food approved and used for chilled food, frozen food and ready meal for microwave oven heating. The material is suitable for cold-, warm-, hot filling and retort sterilization.

Including a barrier layer will result in a high performing Modified Atmosphere Packaging (MAP) or skin pack system using a FFS or thermoforming machine.

Suitable for various applications and segments, e.g. electrical components, industrial applications and secondary packaging.
